PROFESSIONAL SUMMARY

Full-Stack Developer and AI Engineer with a B.Tech in Computer Science from VIIT Pune (8.92 GPA) and hands-on production experience building AI-powered web applications, real-time systems, Qt desktop tools, and Android applications. Designed and delivered multiple systems currently in use at Pinetics, covering areas from serial communication utilities to an AI-driven applicant tracking system. Published researcher in NLP and sentiment analysis (Springer, 2021). Looking to bring this range of experience to a high-impact software engineering role focused on building intelligent, scalable products.

EXPERIENCE

Pinetics | Pune, India

Software Developer Intern Aug 2025 – Present

AI / Automation

- Applicant Tracking System: Built a production-grade ATS that processes the company's existing resume database using async pipelines (BullMQ + Upstash Redis), semantically ranks candidates against job descriptions using vector embeddings (ChromaDB), and automatically generates a shortlist with contact details for personalised outreach — reducing manual screening effort by approximately 80%.

Mobile & Web Development

- EarthFit BLE Scanner (Android): Developed an Android application that continuously scans for nearby BLE devices broadcasting under the name EarthFit, parses their hex advertising payloads to extract sensor readings, and sends the data to a backend REST API. Implemented a foreground service with battery optimisation disabled to ensure uninterrupted background scanning at one-minute intervals.
- Pinetics Corporate Website (WordPress): Redesigned the company website to clearly communicate their products and services, integrated Typeform for lead capture with automated notifications, and created a pre-booking page for their System-on-Module product. Improved the Google PageSpeed score from 40 to 90+ using the LiteSpeed plugin — directly contributing to the company's first customer enquiries and enabling Google Ads campaigns.

Qt Desktop & Embedded Tools

- Built three internal Qt desktop utilities at Pinetics: a serial communication app for TTL-to-device data exchange with dual developer/user interfaces, a visual GUI for a Python-based OLED bitmap font generator, and a TCP client for remotely configuring device MAC addresses with hex validation and XML persistence.

VIIT | Pune, India

Research Intern Jan 2021 – Jun 2021

- Implemented and benchmarked multiple state-of-the-art sentiment analysis algorithms across diverse datasets, analysed their performance trade-offs, and authored 'Study and Empirical Analysis of Sentiment Analysis Approaches' — published in a Springer book.

PROJECTS

AI GitHub Issue Solver Agent | *React · Node.js · GitHub API · ChromaDB · Gemini API*

GitHub: github.com/manieshgupta/github-issue-solver | Live Demo: your-live-demo-link.vercel.app

- Built an agentic AI tool that accepts a GitHub repository URL and issue number, uses vector embeddings to identify the most relevant source files, generates a targeted code fix via the Gemini API, and automatically opens a pull request with the changes applied — end to end, with no manual intervention.
- Designed a repository indexing pipeline that stores file embeddings in ChromaDB and retrieves only the most context-relevant code per issue, keeping token usage efficient and fix accuracy high.

Real-Time Collaborative Code Editor | *React · Monaco Editor · Socket.io · Node.js · Redis · Judge0 API · Gemini API*

GitHub: github.com/manieshgupta/collab-code-editor | Live Demo: your-live-demo-link.vercel.app

- Developed a browser-based collaborative IDE supporting simultaneous multi-user editing with live cursor sync and conflict resolution using operational transforms — similar to Google Docs, but for code.
- Integrated the Judge0 API for sandboxed in-browser code execution across 10+ languages, and an AI inline suggestion engine (Gemini API) that completes code based on the current file's context. Added shareable room links and session persistence via Redis.

No-Code Workflow Automation Builder | *React · React Flow · Node.js · BullMQ · MongoDB · OAuth 2.0 · Gemini API*

GitHub: github.com/manieshgupta/workflow-builder | Live Demo: your-live-demo-link.vercel.app

- Built a self-hosted Zapier alternative with a visual drag-and-drop node editor (React Flow) where users chain trigger, condition, and action nodes to automate tasks across Gmail, Slack, GitHub, and Google Sheets — with custom JavaScript logic nodes for advanced transformations.
- Implemented OAuth 2.0 for all service integrations, BullMQ with dead-letter queues and automatic retries for async execution, cron-based scheduling, and an AI node (Gemini API) that can summarise or transform data at any point in the pipeline.

SKILLS

Languages: JavaScript / TypeScript, Python, C++

Frontend: React.js, HTML5, CSS3, TailwindCSS

Backend: Node.js, Express.js, REST APIs, WebSockets (Socket.io), BullMQ

Databases: MongoDB, Redis, ChromaDB (Vector DB)

AI / ML: Gemini API, RAG Pipelines, Vector Embeddings, NLP

Tools & Platforms: Git / GitHub, Docker, Linux, Vercel, Render

EDUCATION

Bachelor of Technology — Computer Science Engineering | 8.92 GPA

Vishwakarma Institute of Information Technology (VIIT), Pune 2017 – 2021

Relevant Coursework: Computer Networks | Operating Systems | OOPs | DBMS

PUBLICATION

Study and Empirical Analysis of Sentiment Analysis Approaches — Springer Book, 2021. A comparative empirical study of machine learning-based sentiment analysis algorithms evaluated across multiple datasets.
